- Hashing

Introduction:

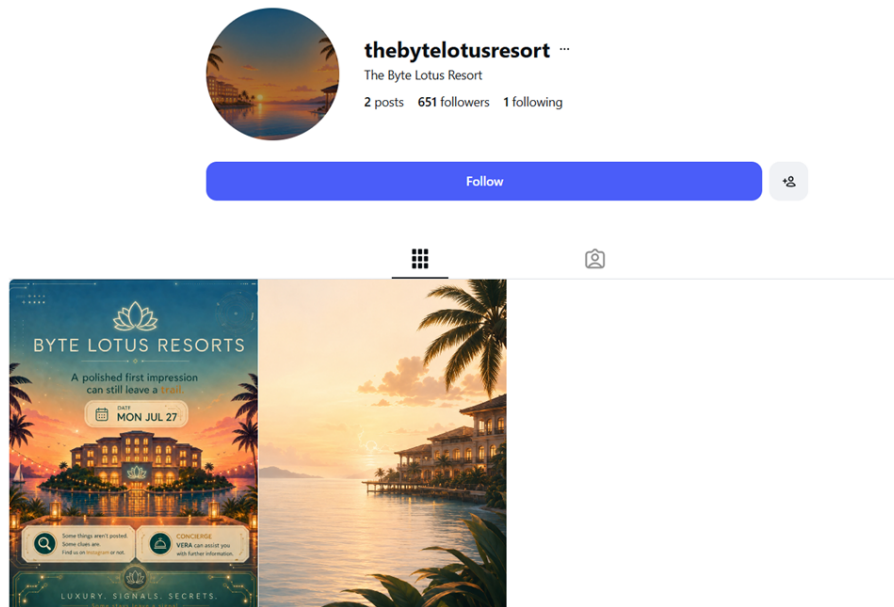

Overheard at Breakfast is a TryHackMe OSINT challenge that analyzes an intercepted conversation at the Byte Lotus Hotel between two guests.

Task 1: Find the flag

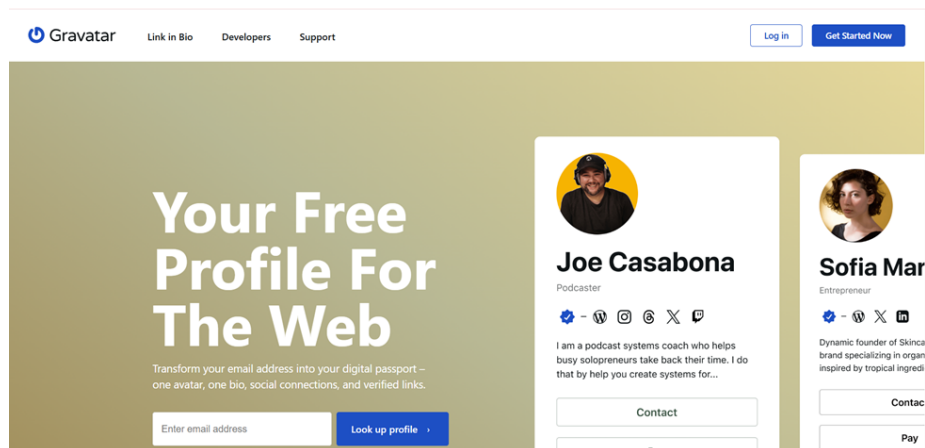

The main evidence which was given to us through the screenshot of a conversation between Ponzi and Lambo. In the conversation, the Hotel Byte Lotus was mentioned.

When the hotel was looked up on Instagram, the result that we got was a page which contained the basic information about the hotel itself.

In the conversation, there was mention of a tool starting from G which was used in order to upload the profiles of Lambo. This tool is Gravatar.

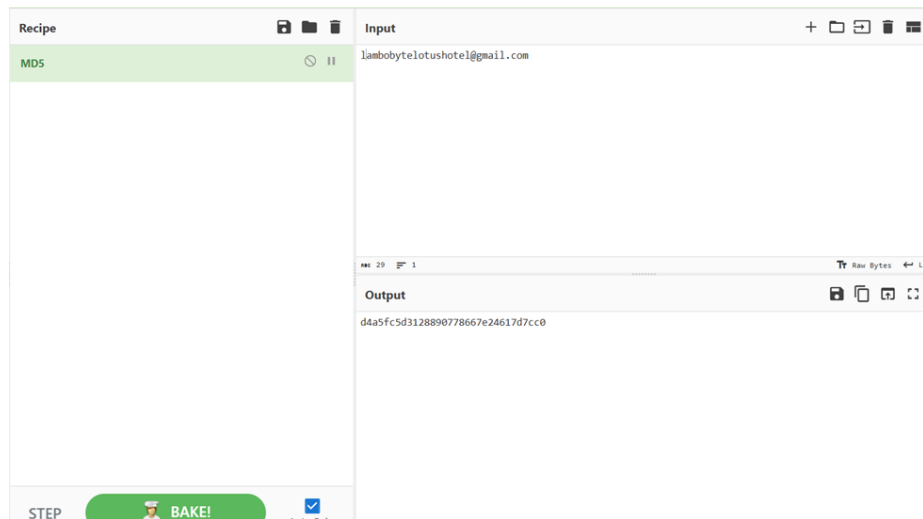

In Gravatar, if you place the MD5 hash of a user's email in lowercase after the link, in the following way:

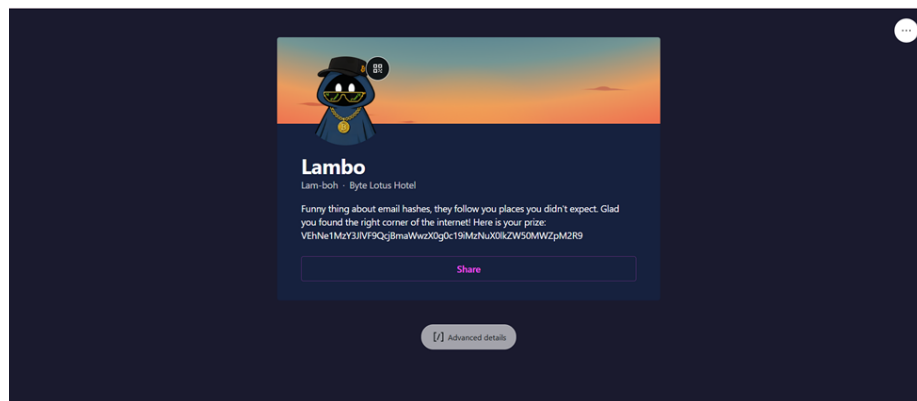

`gravatar.com/?insert hash here'`

you can get the details of the user. In this case, we already obtained the email

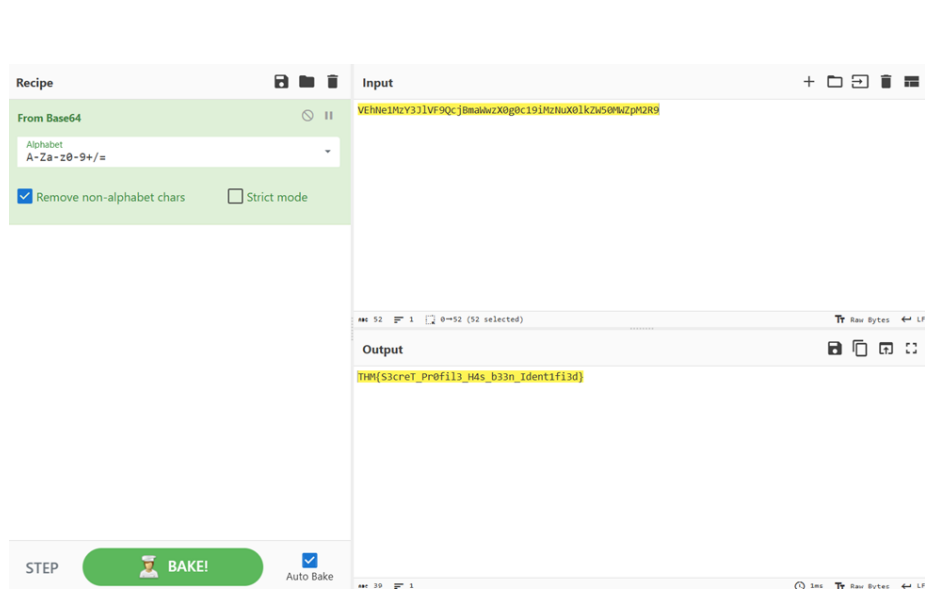

address from the screenshot of the conversation. So now, the email address was hashed through the use of Cyberchef.

The profile was found on Gravatar as below:

The hashed value given in the profile is then taken to Cyberchef again, and it is then decoded using base64 to get our required flag.

Conclusion:

By generating the cryptographic hash of Lambo's email address, we successfully located the corresponding Gravatar profile and retrieved the target metadata. Decoding the embedded Base64 string exposed the hidden flag, effectively completing the investigation.
